

How I discovered Cranial Adjusting for Learning Difficulties

Initial Problem

My son got the handle bar of another BMX racer caught in his helmet and it threw him to the ground. I did what any Chiropractor would do; I rushed to him, examined and adjusted his neck right there on the track. The bruise on his left forehead and into his hair line would go away, I thought. My son finished the races that Sunday. He came home from school on the next day and asked me "Dad, what is wrong with me? I can't read or do math or write properly. Am I going to die?"

What to do?

The next weekend I went to New York to learn Neural Organization Technique from late Dr Karl Ferrari DC. I learned his method of adjusting the sphenoid and in 10 days my son was back to normal.

Share with other patients

I started treating other patients with learning difficulties with equally amazing results. Parents would ask me, "can you help ADD or ADHD" and we started to work on them. I developed a much more extensive protocol for adjusting the skull and started to attract a wide variety of special needs children. One mother asked me if I could help her Autistic child. I told her, "You never know how much you can help, but we do know the boy will be much better off with his spine and skull corrected and I would love the opportunity to see how much we can help."

Share with other Chiropractors

Chiropractors from all over the world would bring their special need child to us for help. When they saw the results we were getting, they wanted us to teach them the technique. In 2003 Cranial Adjusting Turner Style (C.A.T.S), was created. Now there are over 750 C.A.T.S. Chiropractors worldwide getting amazing results with head injuries, learning difficulties, headaches, special needs children, failure to latch babies, dementias, poor memory, personality disorders and Autism.

Been Everywhere; Done Everything

Many patients are frustrated that they are not getting the results they would like. They have been everywhere and done everything and still have their health challenges.

Solution

Everything has not been done until the skull has been examined and the misalignments corrected.

Benefits

- Initial examination reveals cranial misalignments
- Treatments are fast and painless
- Results are seen on the first day in most patients
- Initial intensive care can be done in 2 weeks.
- We never know how much we can help. That depends on so many factors. What we do know is that everyone is better off with the cranial bones aligned.
- We appreciate the opportunity to see how much change is possible.

The sphenoid is the bone in the skull that is involved with most learning difficulties. When it is indented on the left it affects math and speech, when it is indented on the right it affects reading. Headaches may also accompany misaligned sphenoid's and they are called migraine headaches.

Treatment Protocol for Learning

The following procedure is for learning difficulties:

1. The patient reads a passage at his or her level before the first treatment is done. It is important that both parents be present to observe the before and after results.
2. The first treatment consists of 120 different tests. Positive tests are noted and appropriate corrections are applied.
3. The patient then reads again. There is always an improvement in reading ability, even in accomplished readers. For some, the improvement is dramatic, for others more subtle; but there is always some change.
4. Nutritional and supplementation recommendations are made and further testing may be recommended.
5. A homework program is assigned consisting mostly of left brain/right brain exercises; some reading drills and co-ordination routines are also included.
6. The patients are given schedules to follow
7. Subsequent visits are scheduled.

Most frequently asked questions

1. Can you help? All of the learning difficulties we have examined have cranial misalignments.
2. Does everyone get amazing results? Everyone improves, some a lot and some only a little. Unfortunately it is not always as simple as correcting the misalignments in the skull. There are many other factors that play a role in the degree of success for each individual. The families that follow through with the recommendations get the best results. The families that continue to do their previous habits do not get as good results.
3. How long does it take? The initial cranial correction phase takes 15 to 25 treatments. The closer together these treatments occur the faster the results. Most learning difficulties children require 1 month initial intensive treatment and 6 to 9 months of continuous care after the initial correction.

4. Does this last? In most cases it is necessary to maintain the correction for at least 9 months for the body to produce new bone cells and have them grow in place.

5. How much does it cost? As of July 2009 the initial consultation is \$150.00, the first learning treatment is \$100.00 and subsequent adjustments are \$50.00.

Call Sharon to get an up to date fee schedule. 1-705-735-6999 or 1-416-534-8971

6. How do you treat out of town clients? We have people from all over the world come for C.A.T.S. for their special need children. We practice Tuesday and Wednesday in Barrie and Thursday in Toronto. The initial consultation and examination is done Tuesday morning and if we can help, then a series of treatment are scheduled. Five treatments are scheduled for each day. In the first week we can do 15 treatments and the second another 15, if necessary. We can then refer the client to a C.A.T.S. practitioner near them for follow up.

7. Can we get the supplements wholesale? Yes, we will help you to do that.

International Referrals

Patients are referred to Turner Wellness from all over the world by other Chiropractors and satisfied patients.

They come for three to six days and receive 5 adjustments per day. Then we send them to a C.A.T.S. practitioner in their area for maintenance.

"We are not treating medical conditions, only correcting the misalignments in the spine and skull and amazing things happen." Dr. T
